TITLE:

The Use of Vibration for Molding Ceramic Products by the Cast Method (Primeneniye vibratsii pri oformlenii

keramicheskikh izdeliy metodom lit'ya)

PERIODICAL:

Steklo i keramika, 1959, Nr 6, pp 7-12 (USSR)

ABSTRACT:

The paper by Z. A. Nosova and T. Kh. Fedorova (HII Stroykeramika) states that the vibration for speeding up the molding of ceramic sanitary-building materials is suitable only in the case that pre-heated slime and pastes having a reduced content of aluminous components be used. Since quite

a number of questions could not be solved in that

investigation, the NII Stroykeramika carried through some investigations which are the subject of this article. The table shows the composition of the pastes employed. Soluble glass and calcinated soda have been added to the slime as diluting electrolytes. Investigations on the vibration effect

have been undertaken on a vibrating plate designed by

A. Ye. Desov and P. S. Kuznetsov (Footnote 1) and equipped with a mechanical drive of the type constructed by the

Card 1/3

The Use of Vibration for Molding Ceramic Products by $\frac{50V}{72-59-6-2}$ 13 the Cast Method

engineers L. G. Brodskiy and A. A. Velikzhaninov of the PKB NII Stroykeramika. Amplitude and frequency of vibrations has been measured with the manual vibrograph VC-1. The authors refer in this respect to the papers by Yu. I. Iorish (Footnote 2). Figures 1 and 2 give information regarding the vibration influence on paste filtration. Professor V. A. Chernov recommended a method for determining the combined water content in the slime. Figure 3 shows that a reduction of the slime's initial moisture considerably slows down the filtration speed of all pastes investigated. According to the paper by A. V. Dumanskiy (Footnote 3) this is due to the reduction of the quantity of combined water in the initial suspension. The mechanical resistance of the molded piece immediately after extraction from the plaster mold has been determined according to the method of the Academician P. A. Rebinder with a conical meter for measuring plasticity designed by M. P. Volarovich and S. N. Markov, in which connection the authors of this article refer to the papers by I. A. Al'perovich, P. I. Berenshteyn, G. S. Blokh, I. K. Antonevich and I. M. Gorkova (Footnotes 4 and 5). The values

Card 2/3

The Use of Vibration for Molding Ceramic Products by SOV/72-59-6-2/18 the Cast Method

measured are summarized in figure 4. Figures 5 and 6 show the dependence of mechanical resistance on the vibration amplitudes. Conclusions: The influence of vibration increases the filtration speed only slightly and is practically of no influence on the general rate of moisture delivery. The use of the vibration method favors the moisture delivery thus reducing the residual moisture of the molded piece. The action of vibration increases the mechanical resistance of the molded piece which gives the possibility of using pastes having a reduced portion of aluminous components. This method allows molding of slimes having a temperature ranging between 40 and 60 centigrades. There are 6 figures, 1 table, and 5 Soviet references.

PHASE I BOOK EXPLOITATION SOV/5089

Smazki (Lubricants) Moscow, Standartgiz, 1960. 541 p. Errata slip inserted. 5,000 copies printed. (Series: Gosudarstvennyye standarty SSSR).

Ed.: M.L. Elkonina; Tech. Ed.: A. Ye. Matveyeva.

FURPOSE: This book is intended for mechanical engineers, industrial chemists, physicists, petroleum technicians, and other persons interested in the properties of lubricants.

COVERAGE: The book contains specifications and standards for lubricants, compiled by the "Standartgiz" State Publishing House (effective date - 1 March 1960). Current information on both new and revised standards and their revisions, which are published in the <u>Informatsionnyy ukazatel' standartov</u> (Reference Index of Standards), are also included. The specifications stipulate purpose, working conditions (especially temperature), composition, appearance and properties, minimum drip temperature (°C), penetration range at 25°C, corrosivity, thermostability, acid number, water content, and mechanical impurities content of lubricants.

TITLE: Stability of a closed, flexible, orthotropic, cylindrical shell when linear heredity is considered

SOURCE: Moscow. Universitet. Vestnik. Seriya 1. Matematika, mekhanika, no. 2, 1966, 112-119

TOPIC TAGS: orthotropic shell, shell structure stability, cylindric shell structure, fiberglass, elastic stress

ABSTRACT: Presented are detailed calculations of the stability of a closed, circular, axially stressed cylindrical shell of orthotropic liberglass with a reinforcing linen crossweave. The constructed elastic solutions to the problem indicate that inclusion of linear heredity factors lowers the critical load values for fiberglass shells. Critical loads of shells from materials with linear heredity depend essentially on loading programs and increase as the rate of loading increases. Orig. art. has: 17 formulas and 2 figures.

Periodical

: Izv. AN SSSR. Ser. biol. 3, 87-95, May/Jun 1954

Abstract

Recognition of the cell as a unit of living matter focused attention on questions concerning its structure and the manner of its formation. Consequently the study of conditions accompanying formation and movement of noncellular matter within tissues of plants has attracted still greater attention more recently. The authors of this article examined noncellular matter during its various stages of development. They used the following plants in their experiments: Allum odorum, Lilium tigrirum, Bryophyllum, and Hedra helix. They discovered that rudimentary radicels found on the stem of Hedera helix consist of matter which has no cellular structure, and contain no nuclei: they are at the stage at which they begin to differentiate into cells each containing a nucleus. Comparative data of physicochemical properties of cells presented in a table.

Non-mitotic methods of reproduction in plant cells.

Periodical:

Izv. AN SSSR. Ser. Biol. 2, 59-82, March-April, 1955

Abstract :

Experimental Observations of special and modified forms of amitosis which are referred to by the author as non-mitotic are described. This included observations on the formation of a nucleus within a nucleus in the process of ontogenetic development of cells, the propagation of nuclei in relation to the division of nucleoli, the formation of a nucleus from baseophilic substances of the cell plasma, development of nonnucleated cell precursors, and the propagation of nuclei in the aerenchyma tissue of the tomato callus. TITLE: Use of surface-active additives for increasing the strength of the concrete in cooling towers

SOURCE: Beton i zhelezobeton, no. 1, 1967, 13-16

TOPIC TAGS: reinforced concrete, surface active agent

SUB CODE: 11

ABSTRACT: For the preparation of the concrete used in the construction of reinforced concrete cooling towers, the authors recommend the use of low-aluminate portland cement with an addition of not over 10 percent active hydraulic agent in order to guarantee longer service life for the towers. For the necessary increase in the frost-resistant quality of these concretes, the authors recommend reducing the amount of hydraulic additive, increasing the quality of the mixing technology and improving the curing process by using additive No 7. A description is given of tests conducted by the ORGENERGOSTROY Institute and the Moscow Construction Engineering Institute (MISI). Test data on the use of additive No 7 are discussed and tabulated. New Data on Geological Structure and Formation of the Northern Part of the Aksubayevo-Melekess Depression (Novyye dannyye o geologicheskom stroyenii i istorii formirovaniya severnoy chasti Aksubayevo-Melekesskoy

depressii)

PERIODICAL:

Uch. zap. Kazansk. un-ta, 1956, Vol 116, Nr 5, pp 194-

197

ABSTRACT:

The Aksubayevo depression lies between the Tatarsk and Tokmovo anticlines. Along the lower levels of the Devonian period, it passes, to the north, into the narrow meridianal Kazan flexure, and to the northeast, into the Zayinsk-Saraylinskiy progib (flexure), which divides the north and south extensions of the Tatarsk

Card 1/2

15-57-8-11387

New Data on Geological Structure (Cont.)

dome. Along the Schwagerina level, to the west, the depression is bounded by a steep monocline, complicated by the Pichkasskaya and Bugry struktury (structures), while its eastern border is complicated by terrace-like steps. The contours of the Aksubayevo depression coincide on all levels and are in good conformity with the gravity map. The Aksubayevo-Melekess depression is basically of post-Permian age. Oil accumulation traps are believed to exist in the lower Frankian, Givetian, and Visean zones on the western border. Permian bituminous developments along the periphery of the depression are favorable indications of the existence of petroleum deposits in the Carboniferous and Devonian on the western border.
